

## 15' TUBE LIGHT INSTRUCTIONS

TUBE LIGHT CAN NOT BE USED IN HIGH WINDS OR FOUL WEATHER CONDITIONS.

BE SURE TO SELECT A LOCATION WHERE THERE ARE NO OVERHEAD OBSTRUCTIONS AND WHERE IT CAN BE TETHERED TO THE GROUND.

Manual assistance is required to inflate and deflate the tube. A long object may be necessary to push the top of the tube into a vertical position. The bulb is at the top of the tube and can NOT fall to the ground

### TURNING ON:

1. Plug in the light tube to a 110v grounded outlet.
2. On the side of the blower (red box) flip the BREAKER to ON.
3. Next flip the AIR switch to ON.
4. Extend the tube to its fullest length and hold the lamp at the top of the tube. Hold the tube until it is fully inflated.

5. Gradually walk push the tube up in the air by “walking” it up. The tube will be top heavy due to the light bulb. A long object or pole may be needed to push the position above the blower.
6. Next stake the four tethers to the ground to secure the tube and prevent it from blowing over.
7. Flip the LIGHT switch to ON. The bulb will take time to fully light.

### TURNING ON

1. Turn off the LIGHT and keep the blower running for 10 minutes to allow the lamp to cool. If the lamp is not cool it can burn the fabric and/or a person's hand.
2. Once the light has cooled you are ready to proceed. First loosen the tethers and remove the stakes.

**WARNING:** When the air is turned off the tube will deflate and the heavy light at the top will fall. Be sure to catch the top of the tube to prevent it from hitting the ground and damaging the lamp.

3. Turn off the air and catch the light as it falls to the ground. Use the tethers to control the fall of the tube.
4. Extend the tube to its fullest length and gently roll up the tube to position it on top of the unit while squeezing the air out of the tube.

**CAUTION:** The lamp must be fully cooled prior to rolling up the tube.
